

INFRATHRONE (COREOPS TRACK)

WEEK 1 ASSIGNMENT PACK (Linux + Kubernetes Fundamentals)

Theme: Building the Foundation of Outage Handling

This assignment is designed to push you slightly outside your comfort zone while keeping everything achievable.

You must submit screenshots, notes, and your debugging explanation for each task.

The goal is not perfection; the goal is understanding.

Pod Lifecycle & Crash Debugging (Mandatory)

Objective:

Understand how Pods behave and why 80% of issues relate to the pod lifecycle.

Tasks:

1. Deploy a working NGINX pod: **kubectl run web --image=nginx**
2. Break it intentionally using a wrong image tag: **kubectl run web2 --image=nginx:wrongtag**
3. Investigate using:
 - a. **kubectl describe pod web2**
 - b. **kubectl get events**
 - c. **kubectl logs web2**
4. Fix the issue by deleting and recreating with the correct image.

Submission:

- Screenshot of error in kubectl describe
- Clue you found
- Write: **“What is the root cause and what would I check first if this was production?”**
