

INFRATHRONE (COREOPS TRACK)

WEEK 1 ASSIGNMENT PACK (Linux + Kubernetes Fundamentals)

Theme: Building the Foundation of Outage Handling

This assignment is designed to push you slightly outside your comfort zone while keeping everything achievable.

You must submit screenshots, notes, and your debugging explanation for each task.

The goal is not perfection; the goal is understanding.

Observability: Logs + Events + Metrics

Objective: Learn how to observe system behavior to detect early warning signs before a full outage.

Tasks:

1. View container logs: **kubectl logs web**
2. Tail logs: **kubectl logs -f web**
3. View event history: **kubectl get events --sort-by=.metadata.creationTimestamp**
4. Install minimal Prometheus stack (optional bonus):
helm repo add prometheus-community
<https://prometheus-community.github.io/helm-charts>
helm install prom prometheus-community/kube-prometheus-stack
5. Explore metrics:
 - a. CPU usage
 - b. Memory usage
 - c. Pod restarts

Submission:

- Events screenshot
- Pod logs screenshot
- Short paragraph: “How logs + events + metrics together form the first layer of outage detection?”
