

InfraThrone CoreOps (Week 1 Daily Module)

Theme: Linux + K8s Foundations for Outage Handling

Each day contains:

1. **What to Study**
2. **What to Practice (Hands-On)**
3. **Where to Study (trusted & curated)**
4. **InfraThrone Mindset Notes**

DAY 1: Linux as the Foundation of War Rooms

1. Concepts to Study

- What is a Process? PID, PPID, orphan, zombie
- CPU vs Load Average
- Memory basics: RSS, cache, swap
- File descriptors, ports, sockets
- Signals (SIGTERM, SIGKILL, SIGSEGV, SIGSTOP)
- Linux boot basics (for context)

2. Hands-On

Run the following on any Linux VM/container:

- `top` → identify CPU & memory usage
- `ps aux` → locate top processes
- `strace` a running process
- Read `/proc/<pid>/status`
- Trigger CPU spike using: `yes > /dev/null`
- Trigger memory spike using Python script
- Observe system behaviour

3. Where to Study

- [FreeCodeCamp](#)
- [Shawn Powers](#)
- `man top`, `man ps`, `man proc`

4. InfraThrone Mindset

“Before Kubernetes, before containers, it is ALWAYS Linux underneath. If you cannot read a Linux system, you cannot solve real outages.”

THE DEVOPS WAR ROOM
